This is dancing (can't click or scroll)

Total clients (practitioners own clients), then a line below showing clinic's total clients, and percentage increase/decrease compared to previous month?

Now

- 'Insights' > Marketing side on clinic portal

Next steps page for insights... could include 'send offer' and select patients they want

QC, Audit, redundancy check of all numbers and make sure nothing is repeated

Entire retention page customisable by period - each card gets updated by period selected

Consistent duration picker for all the metrics pages - default is year

Clickable cards on insights page (pipeline and book) which direct to the in-depth data part of the page.

- Practitioner portal
- Patient portal
- Optimising what each role is able to see
- Creating a rule sheet for AI to use whenever changes are made (will discuss in next call)
- Deployment & optimisation at minimal cost
- Third is you going through the Lean Startup book, understanding it very, very thoroughly, and understanding the business model canvas.
- Document QAs —> pricing, features, sign-ups, migration of data, etc.
- Document sheet for sign ups —> if they're more receptive then take info

This is apparently showing treatments due for all practitioners in the clinic, when it should only show the treatments due for the practitioner who's signed in

Visit notes need to remain in the patients profile, associated to their treatment. Here, is the notes added for the upcoming appointment only, for practitioner to consider for treatment

10:00

Visit note

Peel endpoint reached.
Neutralised. Strict sun avoidance
discussed; next sitting booked.

Arrived

Nadia Petrova

#4 · Profhilo

Consent ✓

Paid

Only way the status changes automatically to 'waiting' is if the patient is checked in as 'arrived' and they had already completed their consent from before. However, if they have not completed their consent, and they have arrived in clinic and have been checked in, then the receptionist needs to ask them to complete the consent form in clinic, and once that's done, the status will move into 'waiting'.

When it moves into waiting, the patient's practitioner is notified and nudged to start treatment in the pop-up on the right.

If practitioner clicks 'start treatment', the app takes the practitioner to the patient profile where a 'treatment page/form' pops-up.

In the pop-up page for the treatment form:

1. The first page will have the patient's details and treatment details, like time and type of treatment. Below that it will have previous patient notes/visit notes for the practitioner to view or read before starting the treatment. Maybe put some questions or pre-treatment consultation questions if that's needed as well.
2. At the bottom it will have a button saying "Start Treatment." Once the practitioner presses that button, that will update on the system or the clinic portal. It will update on the patient's appointment card, where the status changes and shows that the patient is currently in treatment. This way other members working in the clinic, such as the receptionists and managers, will then know that that patient is in clinic with their practitioner.
3. That form moves into the second page, which is the page that the practitioner can use to input any treatment results, treatment notes, anything to do with the actual treatment being carried out, and any visit notes at the bottom. Below that there will be a button that the practitioner will click that will say "Move on to Aftercare" or something along those lines. The practitioner will have to click that, which will update the patient's appointment card status to the aftercare status. That means that they have completed the treatment and now they are going into the aftercare.
4. When that button is clicked as well, it moves into the third page. That page has a few bullet points that the practitioner can read out to the patient with any aftercare tips or things that they should keep in mind. Those aftercare notes should be appropriately matched up to the type of treatment that is being completed.
5. After the aftercare notes, right at the bottom, there should be a button saying "Complete Treatment." Once that is clicked, that would update the status on the patient's appointment card, updating it to be 'complete'.

When that treatment is completed what then happens is that the file or treatment page/form gets saved onto the patient's profile and each tab is updated accordingly. For example:

- The treatment history will be updated, showing the current treatment that was just completed, with any treatments and any notes that were added during the treatment.
- The visit notes section will also be updated.
- Any before-and-after photos taken during the treatment will also be updated in the before-and-after tab.
- The file just gets saved as a physical viewable document in the treatment history that can later be viewed anyone that's working in the clinic.

Home

- For the 'next appointment' card on the patient portal, it should only appear at the top once the patient has confirmed their appointment. Otherwise it shouldn't be there. If there is no appointment booked in, then an appointment card can have a call to action for the patient.
- Correcting the green ticks in the Your Plan Progress card.
- Removing "Latest message from your clinic" when there is a latest message from your clinic. If the patient clicks on the message button (pop-up) at the bottom right of the page and the message has been opened, then something needs to change on that "Latest message from your clinic" card on the home page. It should say that the message has been read and maybe update the call to action. Instead of "Reply" it just lets the patient know that they have actually read the message and whether or not they want to reply.
- On the support pages remove the message page completely because we don't need it. If I click the Reply button on the "Latest message from your clinic" card that's on the homepage, then that should open up the message popup on the bottom right of the page.
- Remove the bottom panel saying 'you're doing great'.

In terms of the offers being given to the patients and whatever shows up on their portal, it can be categorised by the stage that they're in.

- If they are in the pre-consultation stage, then we can have an automated email or special offer go out to their email and their portal, offering them a specific kind of offer to rope them back in. Let's say they saw their offer through their email. They would just have to follow the instructions on the email and there will be a button in the email that they would have to click for them to be transferred to the web app, where they would have to log in. Once they log in they can see their special offers on their homepage and they can either activate it or claim it through their homepage.
- If they are in the post-consultation stage, where they've completed their consultation but they don't have any treatments booked in or they don't have a skin plan done, then a specific or special offer would go out to those kinds of people as well in the same way.
- If they are in the third stage (we could call this the single treatment stage, for example, where they've only done one treatment and they don't have a second or third treatment booked), then we can also create a special offer for that.
- There could be a fourth stage where they've actually booked in a skin plan and they have a minimum of three treatments booked and an active skin plan. If that is nearing an end, then we can offer them a special offer to rope them back in and a special offer specifically for

them so that they can continue doing treatments with the clinic close to the end of their skin plan.

We'll just have different categorised offers that we could automate and perhaps we can create or design a way to send customised/personalised offers to specific individuals from the clinic portal.

We need to design another page called the "Design Your Offer Template" page or some page like that, which will be live only for certain roles or team members (for example the clinic owner). If the clinic owner has another marketing team member, then it lives for that role also.

What this page does is offer marketing tools and services where the user can manually design templates or use AI to design the templates. These templates can be used for emails or any other digital channels that we might come up with later. This would live in the avatar profile dropdown as part of the dropdown list, which also has Sign Out, My Team, and other pages.

We can also add a button on each patient's page saying "Send Offer". This tool can be used by the front desk managers or clinic owners, where they can send a specific offer to that specific patient by directly going onto the patient profile (just in case they just wanted to do a one-off).

Apart from the one-off where we send an offer to particular patients by going to their patient page, we can also do a bulk send where we go to the patient table. We select the patients that are inactive or active, or whichever is the relevant state or status, and then have a paper plane kind of a button. When we click on that button we get a list of templates that we want to send to those patients that we have just bulk selected and send them those relevant templates.

Not working, also change the text at the bottom to 'Add note'

Clinician guidance

Please complete this at least 3 days before your next treatment. Message the clinic if anything is unclear.

This step is managed by your clinic. Dates, requirements and progression cannot be edited by patients.

On the Timeline tab page, under your plan roadmap, if there is a task (for example, the treatment session) and it's been completed, pressing on it will show an appointment card on the right-hand side, which will have the treatment details. For example, let's say it's treatment session 2. It will have:

- The appointment date
- Two pills saying "Consent Form" and "Consultation Form" right next to each other
- A title saying "Photos", with before-and-after photos taken in treatment
- Visit notes and a text box to include any visit notes that the practitioner had added during the actual treatment

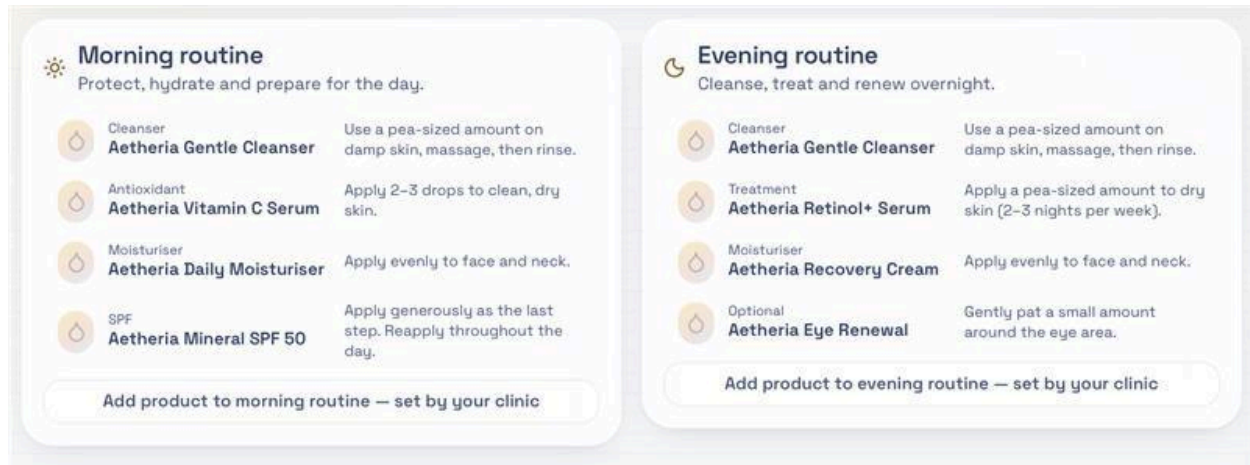

This allows the patient to be more informed on their treatment details and the treatment results, and it allows the clinic to share the data directly with the patient. How the details show up on this treatment card is through the practitioner filling out the treatment form during the treatment (on their portal) and then marking the treatment as completed. All the information and the pictures that have been inputted into that form will then synchronise into this specific treatment details card on the patient's portal under the Your Plan Roadmap in the Timeline tab.

Another thing to adjust: using the same example, if there is an upcoming treatment (for example, in this case, treatment session 3), then that pop-up card on the right-hand side that shows up next to your plan roadmap will then show the due date and the date of the appointment booked for session 3. Underneath, that's where your checklist will show up. This checklist can show up directly after treatment session 2 has been completed so that the patient is well prepared ahead of time for their third treatment. For the upcoming treatments we can add a call or a contact clinic button under the checklist to help the patient be able to contact the clinic or call them very easily in case they have any questions.

We can keep the step detail card for a treatment session that is currently in progress or showing the in-progress status but we don't need the checklist for treatments that have been completed. If a treatment has been completed then it will show the treatment details and it won't need to show the checklist anymore.

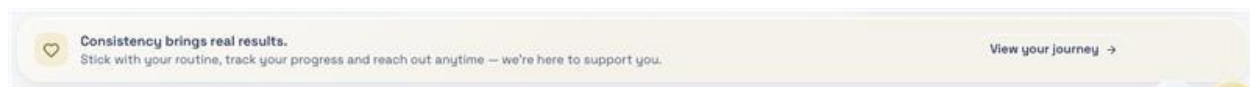

For the journal section I want the tags on each journal entry to be on one line and not text-wrapped. I also want the column of tags to be removed. We can create one button that says "Tags" that the user can press to select which tags they want to view the journals by, like a filter option.

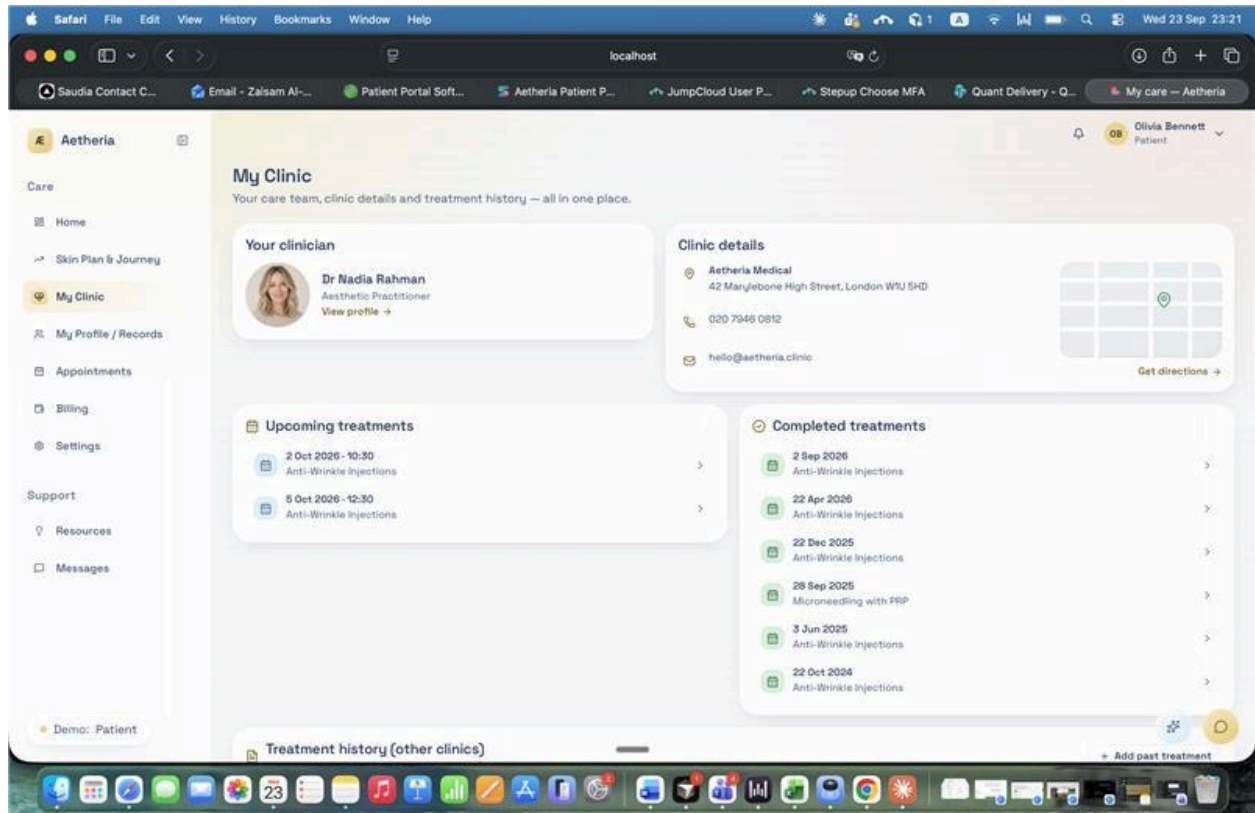

All the boxes/cards across all the tabs across the entire patient platform need to be matching in size or dynamic in design.

In terms of the morning and the evening routine, besides every product that is used as part of the routine, I want there to be an edit button so that the patient can go in and manually add their own product if they wanted to. The morning and evening routine would have the products recommended by their practitioner but they can pick an alternative by pressing the edit button and then inserting a link. The link will update their morning and evening routine according to the product that they have inputted. When using the link it should then be used to extract the product name and the how-to-use information.

Remove this at the bottom of skincare routine page:

As mentioned before we need to remove the Messages page from the sidebar and then move Billing and Settings under the patient's name on the top right in the top bar. Also the My Record page under the patient's name in the top bar doesn't work.

This my clinic page needs the cards to be organised in a nicer way, as mentioned before. Add a button in the Your Clinician card for the patient to be able to message the clinician directly. When pressing "Message Clinician" or pressing the Message button, a direct message will be sent to the clinician and to the clinic itself. That will trigger a message to appear on the practitioner's end of the clinic portal so they can respond directly.
